Understanding ATTR-cardiac amyloidosis (ATTR-CM) and why it happens

ATTR-cardiac amyloidosis (CAR-dee-ak Am-ee-loy-DOE-sis), sometimes called transthyretin cardiac amyloidosis, is a serious, progressive heart condition.

There are 2 forms: wild-type, which is caused by aging, **and hereditary**, which is when the condition is passed down through families.

Actor portrayals.

ATTR-CM is caused when a protein called transthyretin (TTR) becomes unstable

Stable **TTR** is an important protein that helps **transport hormones and vitamins** in the body

Some people have unstable TTR, which breaks down into abnormal proteins called **amyloid fibrils**

These **amyloid fibrils build up in the heart**, preventing it from working properly, and may eventually lead to heart failure

A diagnosis of ATTR-cardiac amyloidosis (ATTR-CM) can turn life upside down, **not just for the person diagnosed, but their loved ones, too.**

Serious symptoms are often overlooked or misdiagnosed

Being able to recognize symptoms is an important way to understand how your loved one is doing. It's also valuable information to help you keep track of your loved one's health and share with their doctor, so together they can make informed decisions about care.

APPROX. of people diagnosed with ATTR-CM **experience**
60% **carpal tunnel syndrome**

UP TO of people also **experience spinal stenosis**, when the space inside the backbone is too small, causing pain, tingling, numbness, and muscle weakness
40%

Other symptoms may include:

- Shortness of breath
- Tiredness or weakness
- Swelling in legs and feet
- Irregular heartbeat
- Digestive problems
- Nerve pain
